UX and UI Design

Objective: To identify the differences between UX and UI Design.

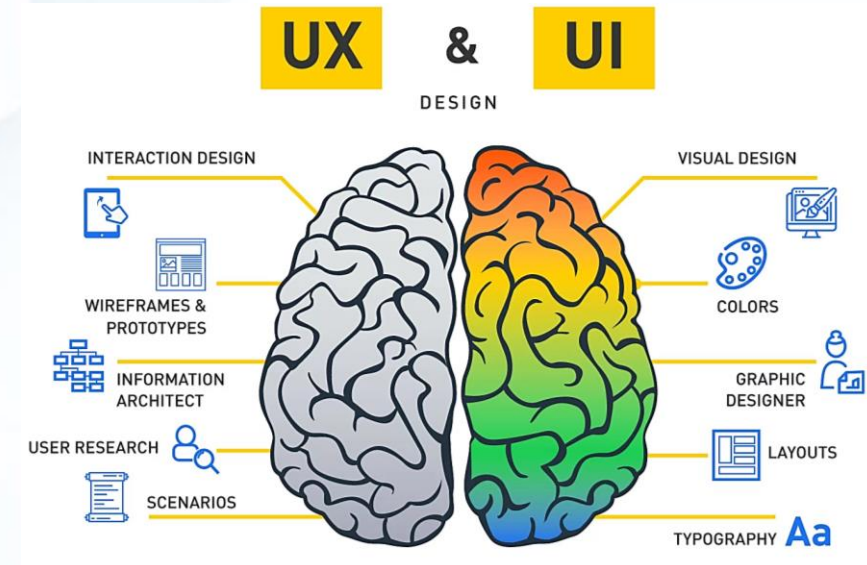

Content:

1. UX and UI Design
2. User experience (UX) design
3. What does UX design involve?
4. What is user interface (UI) design?
5. Difference between UX and UI design

UX and UI Design

UX design refers to the term “user experience design”, while UI stands for “user interface design”. Both elements are crucial to a product and work closely together. But despite their professional relationship, the roles themselves are quite different, referring to very different aspects of the product development process and the design discipline.

User experience (UX) design

User experience design is a human-first way of designing products. Don Norman is credited with coining the term “user experience” in the late 1990s. UX Design encompasses any and all interactions between a potential or active customer and a company. As a scientific process it could be applied to anything; street lamps, cars, and so on.

What does UX design involve?

UX design involves the design of the entire process of acquiring and integrating the product, including aspects of branding, design, usability and function. Refers to the methods and technologies used to collect, distribute, store, analyze, process, and present geographic data.

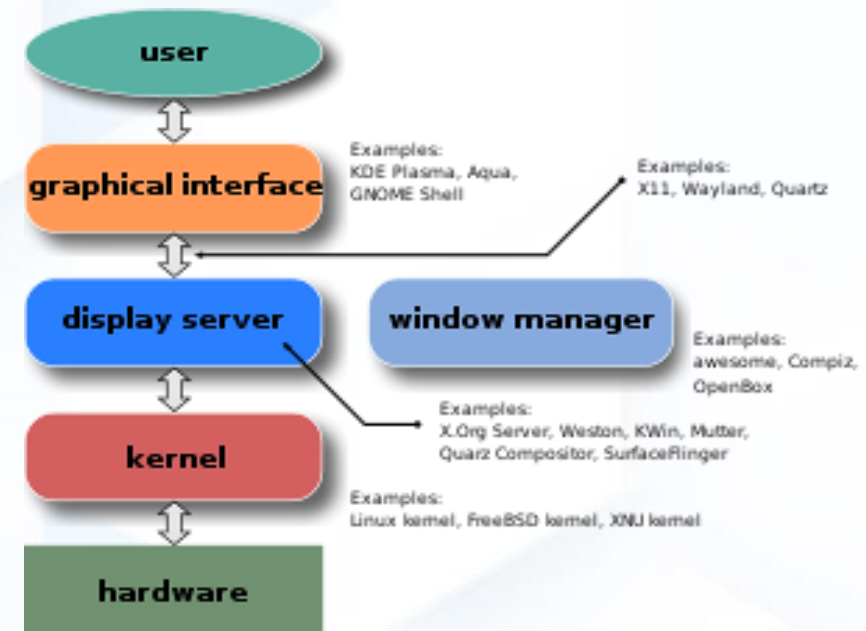

What is user interface (UI) design?

User interfaces are the access points where users interact with designs. They come in three formats:

1. Graphical user interfaces (GUIs)

Users interact with visual representations on digital control panels. A computer's desktop is a GUI.

2. Voice-controlled interfaces (VUIs)

Users interact with these through their voices. Most smart assistants: Siri on iPhone and Alexa on Amazon devices, are VUIs.

3. Gesture-based interfaces

Users engage with 3D design spaces through bodily motions: in virtual reality (VR) games.

To design UIs best, you should consider:

- Users judge designs quickly and care about usability and likeability.
- They don't care about your design, but about getting their tasks done easily and with minimum effort.
- Your design should therefore be “invisible”: Users shouldn't focus on it but on completing tasks.

Difference between UX and UI design

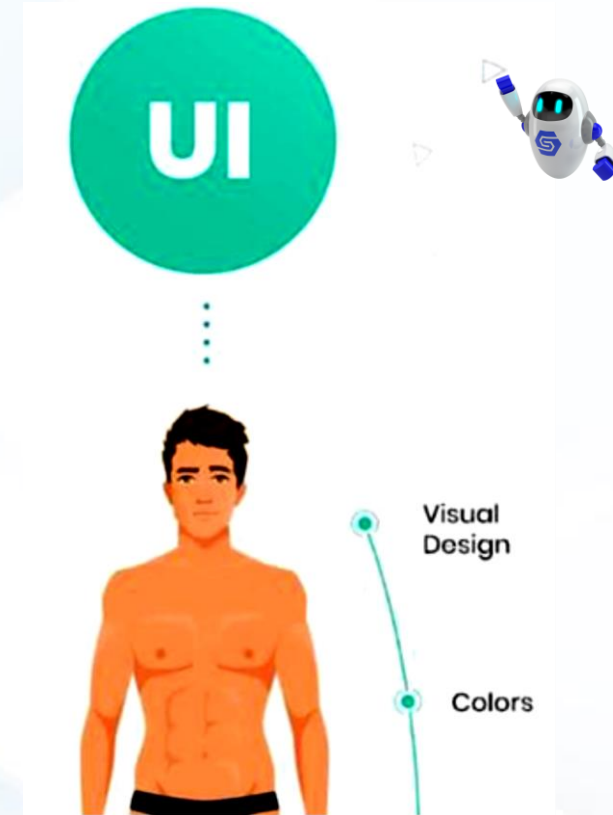

It's important to understand that UX and UI do go hand-in-hand; you can't have one without the other. However, you don't need to possess UI design skills to be a UX designer, and vice versa. UX and UI constitute separate roles with separate processes and tasks! The main difference to bear in mind is: UX design is all about the overall feel of the experience, while UI design is all about how the product's interfaces look and function.

The basic principles of UI design

- Make buttons and other common elements perform predictably so users can unconsciously use them everywhere. Form should follow function.
- Maintain high discoverability. Clearly label icons and include well-indicated affordances.
- Keep interfaces simple and create an “invisible” feel.

UI design guidelines

- Visibility of system status

Systems should offer appropriate feedback within reasonable time.

- Match between system and the real world

Use familiar language your target audience can understand using symbols and objects that relate to the real world.

- User control and freedom

Give users space to go back and undo or redo previous actions.

- Consistency and standards

Standardize every UI element to guarantee consistency throughout your system.

- Error prevention

Reduce any potential errors in your system, and flag them when they happen so the user can fix the issue right away.

- Recognition rather than recall

Minimize the amount of information a user needs to remember by offering help within the specific context in which a user is.

What does a UX designer do?

a. Strategy and content

- Competitor analysis
- Customer analysis and user research
- Product structure and strategy
- Content development

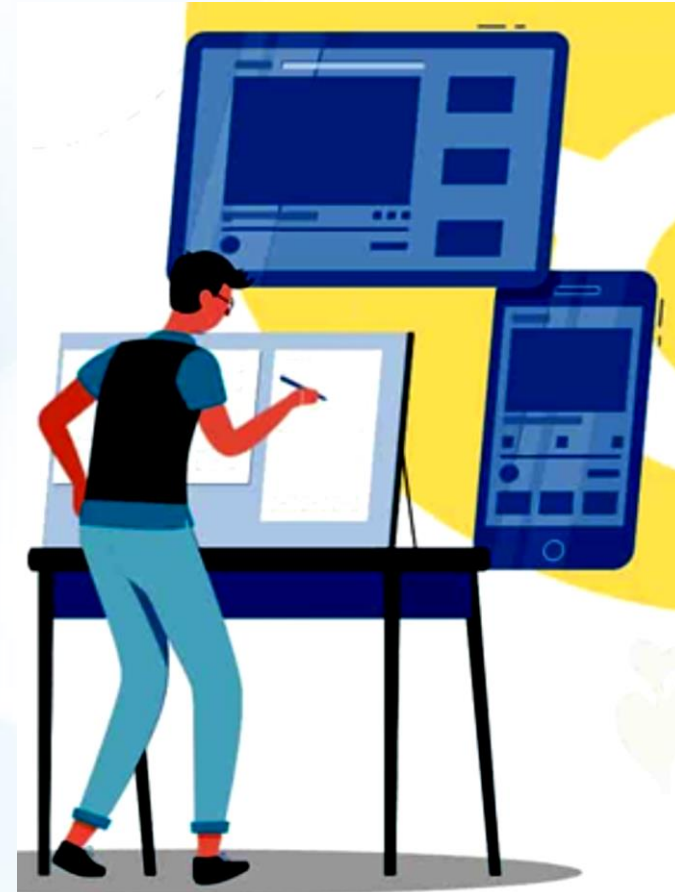

b. Wireframing and prototyping

- Wireframing
- Prototyping
- Testing and iteration
- Development planning

c. Execution and analytics

- Coordination with UI designers
- Coordination with developers
- Tracking goals and integration
- UX analysis and iteration

Skills of a UX designer

- Collaboration, communication, and open-mindedness.
- Empathy
- Curiosity and continuous learning.
- Critical thinking and problem-solving.
- Understanding of information architecture.

Skills of a UI designer

- Collaboration, communication, and open-mindedness.
- Empathy
- Adaptability
- Visual branding skills: Typography, color theory, icon design.
- Animation and interactivity.

Quiz

1. _____ design refers to the term “user experience design”.

- a. UX b. XU c. UI d. IU

2. _____ stands for “user interface design”.

- a. UX b. XU c. UI d. IU

3. _____ is credited with coining the term “user experience” in the late 1990s.

- a. Don Omar b. Don Norman c. Don Ramon d. Doc. Norman

4. It's important to understand that UX and UI do go _____.

- a. Toe to toe b. Elbow to elbow c. Toe to hand d. Hand in hand

5. Keep interfaces simple and create an “_____” feel.

- a. Visible b. Obscure c. Invisible d. Transparent

Quiz

1. ____ design refers to the term “user experience design”.

- a. UX b. XU c. UI d. IU

2. ____ stands for “user interface design”.

- a. UX b. XU c. UI d. IU

3. ____ is credited with coining the term “user experience” in the late 1990s.

- a. Don Omar b. Don Norman c. Don Ramon d. Doc. Norman

4. It's important to understand that UX and UI do go ____.

- a. Toe to toe b. Elbow to elbow c. Toe to hand d. Hand in hand

5. Keep interfaces simple and create an “____” feel.

- a. Visible b. Obscure c. Invisible d. Transparent

Conclusions

User interface (UI) design is the process of designing the look, feel, and interactivity of a digital product. It's important to note that UI design is not the same as UX—although the two regularly go hand-in-hand.

A user interface is the point of interaction between humans and computers. It is the process of designing how these interfaces look and behave. Imagine you're using an app on your smartphone to book flights. The screens you navigate, the buttons you tap and the forms you fill out are all part of the user interface while UX design involves the design of the entire process of acquiring and integrating the product, including aspects of branding, design, usability and function.
